A NEW METHOD OF ELECTROPOLISHING NIOBIUM

H. DIEPERS, O. SCHMIDT, H. MARTENS and F. S. SUN Research Laboratories Erlangen of Siemens AG, Germany

Received 4 September 1971

By a new method of electropolishing nicbium we have obtained very smooth surfaces. In electropolished  $TE_{011}$ -cavities with an anodic oxide film a Q-value of  $3\times 10^{10}$  and a critical magnetic field of 80 mT were obtained in the X-band without any heat-treatment.

There are two ways of producing microscopically smooth and damage-free finishes on nioblum, namely by chemical and electrolytic polishing. Mechanical methods can produce smooth finishes, but only with a high concentration of lattice defects and impurities. Where shapes are complicated, chemical polishing has its limitations since the specimens have to be immersed in the solution under defined conditions of solution flow etc. Local disturbance of the solution flow results in etching instead of polishing at such points. In such a case, electropolishing is to be preferred. The potential distribution between the anode and the cathode can generally be adapted to the geometry of the specimen (anode).

A large number of electropolishing solutions are known [1, 2], which would point to the fact that a special method is necessary for a specific geometry or a specific physical state of the niobium. However, the methods employed so far have the disadvantage that etching is observed when removing layer thickness of, for instance, 100 µm. In many cases, however, it is necessary e.g. for the complete removal of damage

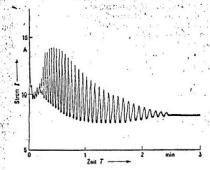

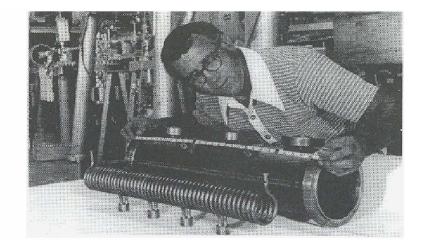

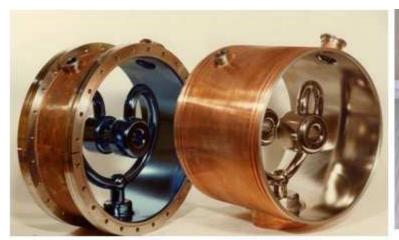

Fig. 1. Electropolishing niobium current oscillations.

in the above-mentioned voltage range. Fig. 1 shows the typical characteristic of this oscillation. The voltage associated with the current oscillations must be controlled at a constant value.

### Why Use a Superconducting Cavity for APS-U?

M. Kelly, ASD Seminar

#### **Properties of Superconducting Cavities**

- Large acceptance
- Low RF losses
- (Suitably) good mechanical properties
- Operate at high accelerating gradients

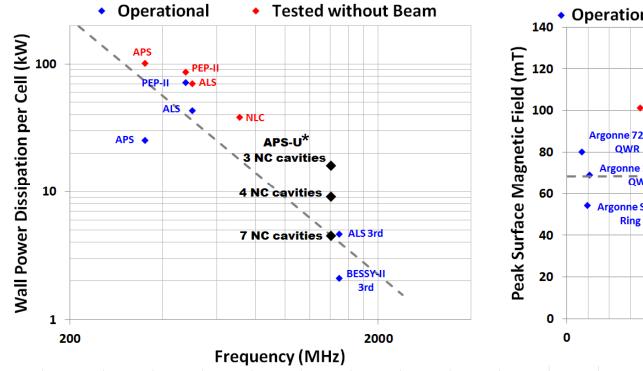

Possible Single-cell RF Cavities for 1.4 GHz

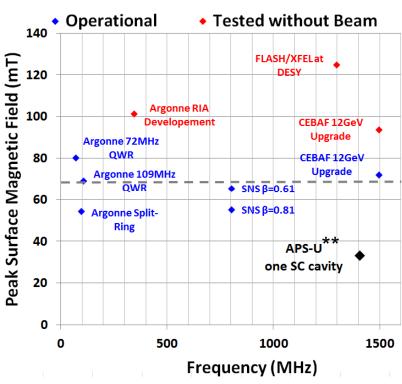

9

## Normal Conducting and Superconducting Cavity Performance

#### **Normal Conducting Cavities**

#### **Superconducting Cavities**

\*assumes a copper cavity with geometry similar to Advanced Light Source (ALS) 3<sup>rd</sup> harmonic cavity, but scaled to a frequency of 1.4 GHz

\*\*assume a 1.4 GHz SC cavity with the 'TESLA' shape

## Spectrum of *Trapped* Higher-order Modes for a 1.4 GHz (ALS-style) Normal Conducting Cavity

- CST used to calculate mode frequency, R/Q, Q<sub>0</sub>
- Typical normal conducting cavities will have a fairly complex set of trapped higher order modes
  - A set of plunger tuners used to 'detune' HOMs
- The superconducting structure has no trapped monopole or dipole higher order modes

cst calculated modes below cutoff assuming copper ALS-style cavity scaled to 1.4 GHz; yellow indicates that the impedance exceeds stability threshold

f (GHz)	Q0	R/Q (Ohm)	R <sub>s</sub> (Ohm)	Mode
1.404	2.5E+04	7.6E+01	1.9E+06	f <sub>0</sub> : TM 010
2.147	2.3E+04	3.7E+01	8.6E+05	TM 011
3.160	2.5E+04	3.1E+00	7.9E+04	TM 020-1
3.461	4.8E+04	3.6E+00	1.7E+05	TM 020-2
3.776	2.1E+04	9.7E-01	2.1E+04	TM 021
f (GHz)	Q0	$(R/Q)_T$ (Ohm/m)	$R_T$ (Ohm/m)	Mode
1.780	2.0E+04	4.1E+01	8.4E+05	TE 111 Horizontal
1.814	2.1E+04	4.7E+01	9.9E+05	TE 111 Vertical

2.193	1.2E+04	3.3E+02	4.0E+06	TM 110 Horizontal
2.710	2.1E+04	1.2E+03	2.5E+07	TM 111 Vertical
2.714	2.0E+04	1.2E+03	2.4E+07	TM 111 Horizontal
3.013	3.0E+04	5.5E+01	1.7E+06	TE 112 Horizontal
3.015	2.9E+04	7.0E+01	2.0E+06	TE 112 Vertical

#### Why Use a Superconducting Cavity for APS-U?

- Requires a single cavity
- Meets APS-U requirements with ample margin on performance
- Straightforward handling of HOMs
  - Lower impedance presented to beam
- Flexibility to adjust loaded quality factor
- These are unique to the superconducting cavity

## Hardware for the APS-U Harmonic Cavity

#### Conceptual Design for a Bunch Lengthening System A single higher-harmonic cavity in a top loading cryomodule

A cryomodule with cavity and ancillaries cooled to 4 Kelvin

One SRF cavity - field driven by the beam

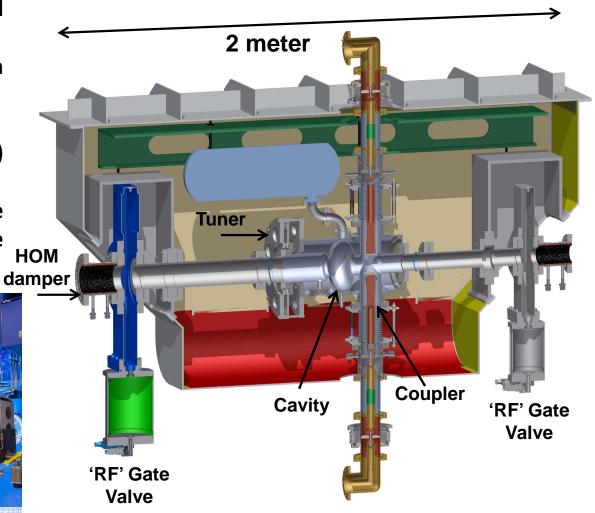

Two power couplers

mechanical (pneumatic) tuner

A pair of room temperature beamline higher-order mode dampers

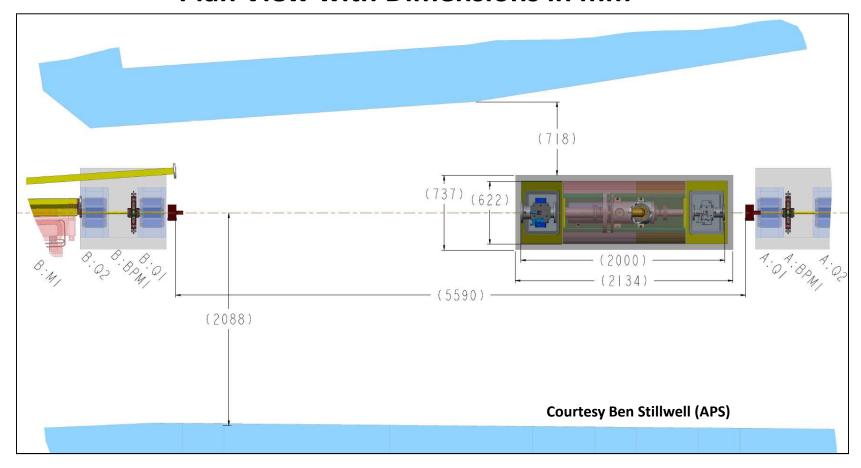

## HHC Cryomodule Footprint in a Generic APS-U Straight Section

#### Plan View with Dimensions in mm

#### Parameters for a 4<sup>th</sup> Harmonic SC Cavity

Cavity operating parameters are modest by today's standards even for the 'relaxed' operating temperature of 4.5 K

	Parameter	Symbol	Unit	Value
	Operating Temperature	Τ	K	4.5
	R/Q	r/Q	Ohm	109
	<b>Cavity Quality Factor</b>	$Q_o$		2x10 <sup>8</sup>
	External Q	$Q_{ext}$		2x10 <sup>5</sup> -2x10 <sup>7</sup>
	Cavity Loaded Bandwidth	$\Delta f_{_{BW}}$	kHz	5.4
	<b>Detuning Frequency</b>	$\delta f_r$	kHz	15
Harmonic Cavity	<b>Cavity Resonant Frequency</b>	$f_r$	MHz	1408
Cavity	Beam-Induced Voltage	$V_b$	MV	0.90
	Detuning angle	$oldsymbol{\psi}_{h}$	degrees	78.9
	Beam Loss Power	$P_b$	kW	32
	<b>Cavity Wall Loss Power</b>	<b>P</b> wall	W	35
	Peak Surface Electric Field	$E_{peak}$	MV/m	17
	Peak Surface Magnetic Field	$B_{peak}$	mT	35

M. Kelly, **ASD Seminar** 

#### Overview of R&D Plan for Important Hardware

The cavity and subsystems are being built largely on demonstrated technology; However, detailed designs for every subsystem are new.

Risks are those associated the cost and delay due to re-work, e.g. a cavity with a defect, coupler manufacturing or durability problems.

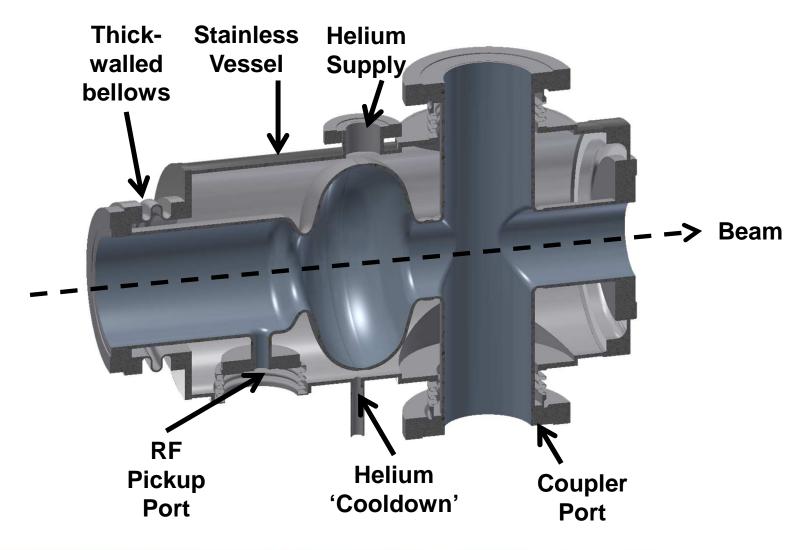

Some technical risks (e.g. those associated with high order modes) are best mitigated by an 'in ring' test

The highest priority development items are:

- 20 kW CW co-axial RF power couplers
- Superconducting RF Cavity(s)
- Higher order mode dampers

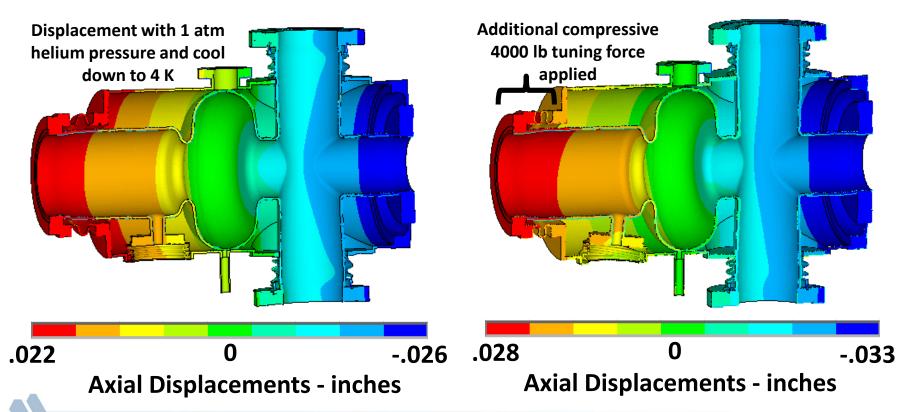

#### **Harmonic Cavity - Section View**

Cavity from 3 mm thick high-purity niobium sheet housed in an (ASME code stamped) stainless steel helium vessel

### Mechanical Analysis for Higher Harmonic Cavity

Parameter	Unit	Value
Slow tuner sensitivity	Hz/lb-f	-163
Tuning range	kHz	600
<b>Helium Pressure Sensitivity</b>	Hz/mbar	6.3
Frequency Shift 300 K to 4 K	kHz	1066
Conditional for Plastic Collapse	PSID	>60

#### Recent Progress on APS-U Harmonic Cavity

Finish machined ports shown niobium tube copper brazed into a stainless flange

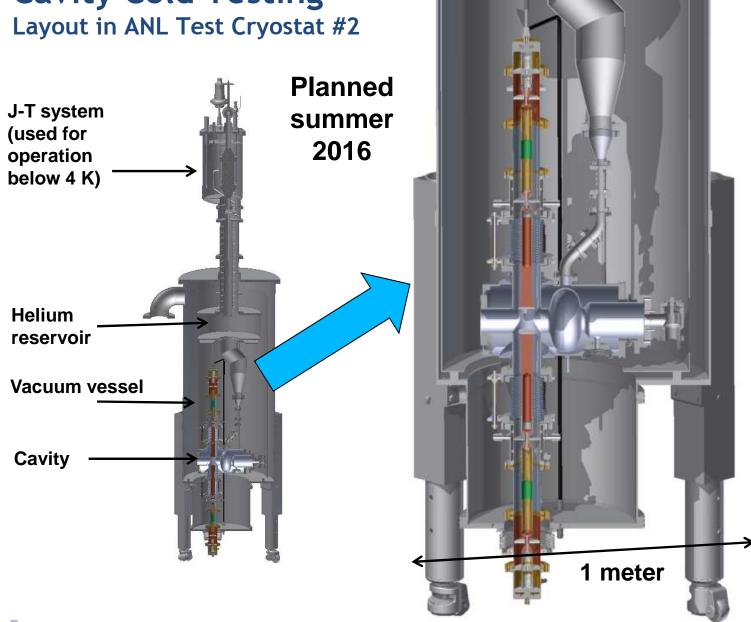

**AES tooling for niobium forming** 

ANL-supplied stainless-toniobium braze assemblies

### **Cavity Cold Testing**

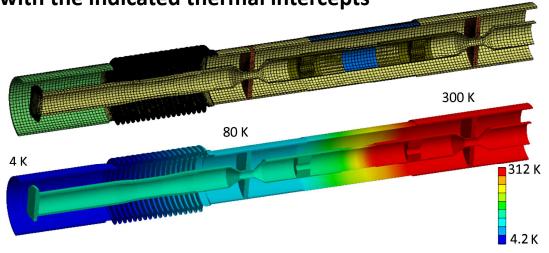

### 20 kW Power Coupler

- No existing design is directly suitable for 20 kW CW, 20 dB variable coupling
  - Note difficult to provide 20 dB variability with a waveguide coupler
- However, essentially all techniques are well established
  - ATLAS, SNS and Cornell ERL Injector
- RF/Thermal/mechanical simulations for an 77 mm diameter, 50  $\Omega$ , coaxial design have been performed in ANSYS and CST MWS

ANSYS simulation of coupler temperature distribution of operation with 20 kW, 1.4 GHz in travelling wave mode with the indicated thermal intercepts

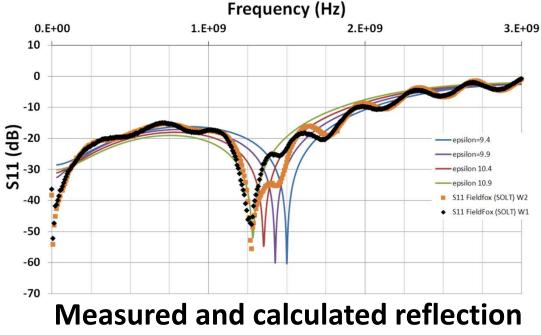

### 20 kW Power Coupler: Parameters

Parameter	Unit	Value
Туре		Coaxial
Line impedance (nominal)	Ω	50
Outer conductor diameter	cm	7.7
Stroke, axial	cm	4
@20 kW		
Power loss to 300 K	W	74
Power loss to 80 K	W	94
Power loss to 4 K	W	2

#### Cold Testing of Power Coupler RF Windows

- Two cold windows are designed and built
  - High-purity alumina 'donut' brazed into copper inner and outer conductors
- A important feature is the matching section (hourglass-shaped central conductor) optimized for frequencies near 1.4 GHz

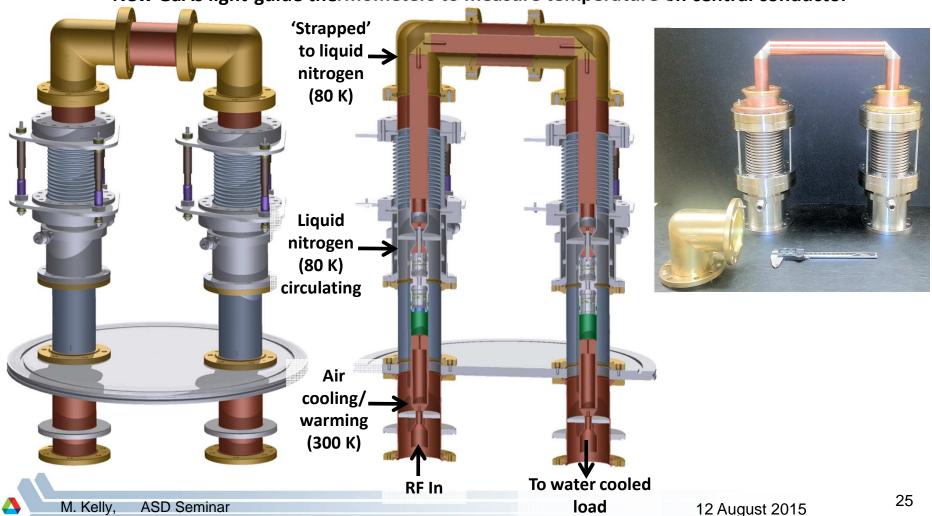

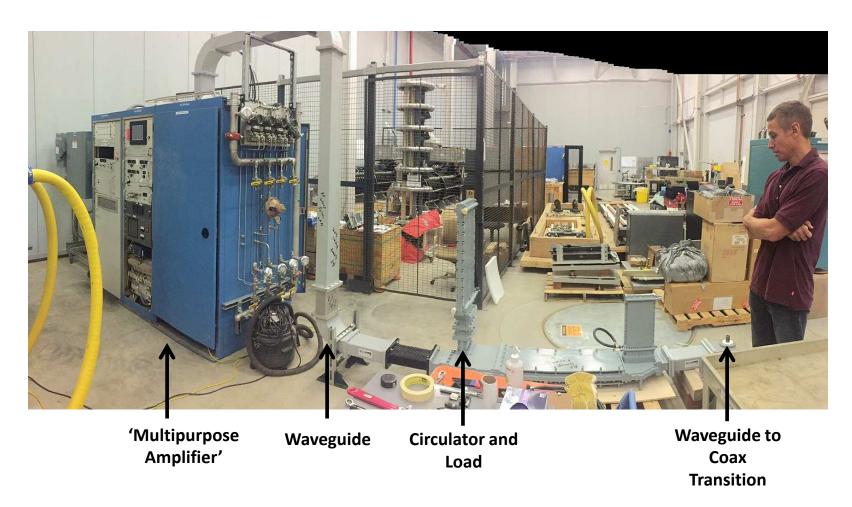

coefficients

#### Power Coupler Testing - Fall 2015

- High-power 20 kW testing with an 'available' 1.3 GHz RF amplifier
- Components will be outfitted with thermometry and heaters to perform calorimetry, directional coupler
  - New GaAs light-guide thermometers to measure temperature on central conductor

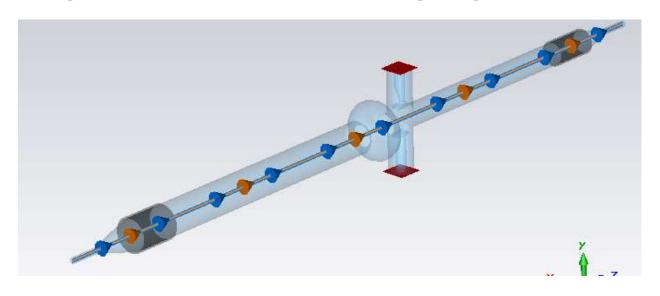

## Power Coupler Testing - Fall 2015 20 kW 1.3 GHz Amplifer to be Test at APS, then Moved to 203

Work of Doug Horan and his crew

### **Higher Order Mode Damping**

A charged particle moving along the beam axis interacts with the cavity and all other components

## Consider excitation of the TM011 higher-order mode in APS-U Harmonic Cavity

- Charge per bunch q<sub>0</sub> = 15.3 nC, total current I<sub>b</sub> = 0.2 A
- Bunch repetition rate = 13 MHz
- Cavity HOM parameters: r/Q<sub>TM011</sub> = 20 Ohm, f<sub>TM011</sub> = 2.64 GHz ∆f=26 MHz
- Deposited Power:  $P_{TM011} = \frac{\omega_{TM011}}{4} \frac{r}{Q} q_0 I_b = 250 \text{ W}$

The bandwidth is of the same order as the bunch repetition rate so that one expects appreciable high-order mode power

#### **R&D Plan for Higher Order Mode Dampers**

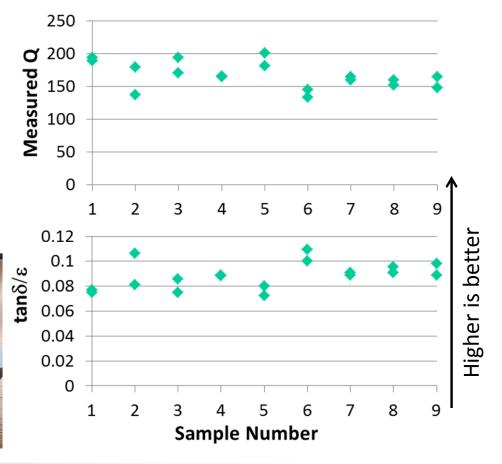

The technique and material chosen based on discussions with Cornell and their work on the ERL injector cryomodule. Thermal/mechanical/electrical studies have been performed to experimentally measure the rf loss properties, electrical and thermal conductivities

Tests on Coorstek 35 samples and cylinders show high rf losses and good room

temperature electrical conductivity

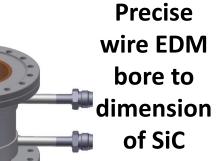

Aluminum Pillbox Cavity
Frequency TM011 = 2.7 GHz  $Q_{cavity} = ^3000$ 

### Fabrication of HOM Damper Prototype

**Copper tube** w/ integral cooling channels

**Brazed to** stainless housing and flanges

29

#### Summary

- A superconducting cavity is the right choice of technology for a bunch lengthening system for the APS-U
  - Will, of course, provide the critical benefit to APS users of increased beam lifetime
- R&D for the cavity, couplers and higher order mode dampers will address the following:
  - Cavity fabrication and 4.5 Kelvin operation (rf losses), microphonics, tuning
  - Most aspects of coupler operations addressed in high-power @ 1.3
     GHz
  - Variable coupler Qext when tested with cavity
- An 'in ring' test would be required to perform realistic tests on the damping of high-order modes
